

The graph displays the proportion of individuals with a specific genotype over time (generations) for eight different islands. The y-axis represents the proportion (0 to 1), and the x-axis represents time in generations (0 to 100). All islands show a rapid increase in the proportion of the genotype, converging to a value of approximately 0.95 by generation 100. Island 3 starts at a lower proportion (around 0.1) and increases more slowly than the others. Island 6 starts at a higher proportion (around 0.8) and increases more quickly than the others.

Island	Initial Proportion (Gen 0)	Approximate Proportion at Gen 100
Island 0	0.5	0.95
Island 1	0.5	0.95
Island 2	0.5	0.95
Island 3	0.1	0.95
Island 4	0.5	0.95
Island 5	0.5	0.95
Island 6	0.8	0.95
Island 7	0.5	0.95
